Department of Computer Engineering

BLG 231E - Digital Circuits

Assignment 1

Student ID :	150200054
Full Name :	Aslı Yel

Part 1 – Computer Arithmetic

- 1) a) Using **signed 2's-complement** representation, convert the decimal numbers **(-102)** and **(-27)** to **8-bit binary** integers. Show ALL work.

(-102)

102 / 2 = 51	remainder 0
51 / 2 = 25	remainder 1
25 / 2 = 12	remainder 1
12 / 2 = 6	remainder 0
6 / 2 = 3	remainder 0
3 / 2 = 1	remainder 1
1 / 2 = 0	remainder 1

natural binary weighted coding:

$$102_{10} = 1.2^6 + 1.2^5 + 0.2^4 + 0.2^3 + 1.2^2 + 1.2^1 + 0.2^0 = 1100110_2$$

8-bit signed binary representation:

$$(+102)_{10} = (01100110)_2$$

2's complement operation:

$$\begin{aligned} (-102)_2 &= [1\text{'s complement of } (+102)_2] + 1 \\ &= 2\text{'s complement of } (+102)_2 \end{aligned}$$

8-bit (+102) ₁₀	:	01100110
1's complement	:	10011001
Add 1	:	+ 1
Result: 8-bit (-102) ₁₀	:	10011010

8-bit signed binary representation:

$$(-102)_{10} = (10011010)_2$$

(-27)

27 / 2 = 13	remainder 1
13 / 2 = 6	remainder 1
6 / 2 = 3	remainder 0
3 / 2 = 1	remainder 1
1 / 2 = 0	remainder 1

natural binary weighted coding:

$$27_{10} = 1.2^4 + 1.2^3 + 0.2^2 + 1.2^1 + 1.2^0 = 11011_2$$

8-bit signed binary representation:

$$(+27)_{10} = (00011011)_2$$

2's complement operation:

$$\begin{aligned} (-27)_2 &= [1\text{'s complement of } (+27)_2] + 1 \\ &= 2\text{'s complement of } (+27)_2 \end{aligned}$$

8-bit (+27) ₁₀	:	00011011
1's complement	:	11100100
Add 1	:	+ 1
Result: 8-bit (-27) ₁₀	:	11100101

8-bit signed binary representation:

$$(-27)_{10} = (11100101)_2$$

b) Carry out the binary operations given below, and explain your answers using terms such as *carry*, *borrow*, and *overflow*. To interpret the results, use only binary numbers.

P.S. I assumed that the operations are carried out on **8-bit** binary numbers and I used mentioned terms accordingly.

i. $(-102) + (-27)$

8-bit signed binary representation (from 1.a):

$$(-102)_{10} = 10011010_2$$

$$(-27)_{10} = 11100101_2$$

addition of 8-bit signed numbers

$$\begin{array}{rcl} 10011010 & : & -102 \\ + 11100101 & : & -27 \\ \hline 10111111 & : & \text{cannot be represented} \end{array}$$

While both operands are negative, result is positive (neg. + neg. \rightarrow pos. overflow case)
Therefore there is an **OVERFLOW**.

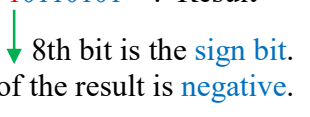

ii. $(-102) - (-27)$

8-bit signed binary representation (from 1.a):

$$(-102)_{10} = 10011010_2$$

$$(-27)_{10} = 11100101_2$$

subtraction of 8-bit signed numbers

$\begin{array}{rcl} 10011010 & : & -102 \\ - 11100101 & : & -27 \end{array}$	<p>2's complement operation:</p> <p>2's complement of $(-27)_{10} = (+27)_{10}$</p> <table border="0" style="margin: auto;"> <tr> <td style="padding-right: 10px;">8-bit $(-27)_{10}$</td> <td style="text-align: right; color: red;">11100101</td> </tr> <tr> <td>1's complement</td> <td style="text-align: right; color: blue;">00011010</td> </tr> <tr> <td>Add 1</td> <td style="text-align: right; color: blue;">+ 1</td> </tr> <tr> <td>Result: 8-bit $(+27)_{10}$</td> <td style="text-align: right; color: red;">00011011</td> </tr> </table>	8-bit $(-27)_{10}$	11100101	1's complement	00011010	Add 1	+ 1	Result: 8-bit $(+27)_{10}$	00011011	$\begin{array}{rcl} 10011010 & : & -102 \\ + 00011011 & : & +27 \\ \hline 10110101 & : & \text{Result} \end{array}$ <p style="text-align: center;">  </p>
8-bit $(-27)_{10}$	11100101									
1's complement	00011010									
Add 1	+ 1									
Result: 8-bit $(+27)_{10}$	00011011									

Operation of subtracting two negative operands (neg. $-$ neg.) is not one of the overflow cases.
So there is **NO OVERFLOW**.

iii. (27) – (102)

8-bit unsigned representation:

$$27_{10} = 00011011_2$$

$$102_{10} = 01100110_2$$

subtraction of 8-bit signed numbers

$\begin{array}{r} 00011011 : 27 \\ - 01100110 : 102 \\ \hline \end{array}$	<p>2's complement operation:</p> <p>2's complement of $(102)_{10} = (-102)_{10}$</p> <div style="display: flex; justify-content: space-around;"> <div style="text-align: left;"> <p>8-bit $(-27)_{10}$ 01100110</p> <p>1's complement 10011001</p> <p>Add 1 + 1</p> <p>Result: 8-bit $(+27)_{10}$ 10011010</p> </div> <div style="text-align: right;"> <p>01100110</p> <p>↓</p> <p>No Carry : BORROW</p> </div> </div>	$\begin{array}{r} 00011011 : 27 \\ + 10011010 : -102 \\ \hline 010110101 : \text{cannot be represented} \end{array}$
--	---	--

9th bit of the result is zero. There is **NO CARRY**. There is a **BORROW**.

Part 2 – Boolean Algebra

2) Simplify each Boolean expression using algebraic manipulation (axioms and theorems). Show ALL work.

Show the steps of the simplification, and write which axiom/theorem you used in each step next to the simplification.

a)

$$\begin{aligned}
 & (Y + X'Z')(X + Y' + Z')(X' + Y) \text{-----} \\
 & = (Y + X'X'Z')(X + Y' + Z') \text{-----} && 1. \text{ Distributive } ((Y + X'Z')(X' + Y) = (Y + X'X'Z')) \\
